Summer Travel Safety Tips

As more Canadians get vaccinated against COVID-19 and businesses resume normal operations, people are likely making plans to travel this summer.

According to a survey from the Travel Health Insurance Association of Canada, 80 per cent of Canadians hope to travel in 2021. Of those, 59 per cent plan to take a domestic trip. Also, millennials report being the most excited to plan trips and get back out there this summer.

If you're trading your staycation for a getaway, here are some tips to keep you as safe as possible this summer:

- **Get vaccinated.** While fully vaccinated travellers aren't required to quarantine upon their return, they still must provide proof of a negative COVID-19 PCR test before returning to Canada.
- **Stay domestic.** Although Europe continues to open up to fully vaccinated Canadian travellers, the global travel situation is in flux. Some countries are closing their borders again or enforcing strict curfews and mandates.
- **Take a road trip.** Travelling by car is still safer than flying as it involves less exposure to people.
- **Explore the outdoors.** Outdoor activities are generally safer. Get outdoorsy or visit small towns to distance yourself from others easily.

- **Check travel restrictions.** Be flexible and continue checking local policies for where you are, along your route and where you are going.
- **Keep up with COVID-19 safety precautions.** Pack extra masks and hand sanitizer for any outing. Regardless of your vaccination status, you should still wear a mask, avoid crowds and wash your hands frequently when travelling.

If you're not travelling this summer, use your vacation time to reconnect with friends and family who you've missed.

Travel Considerations

The most important aspect of travelling is to stay safe and healthy. If you're not comfortable travelling this summer, you can always start planning your 2022 dream getaway.

Green Bean and Mushroom Medley

Makes: 8 servings

Ingredients

- 700 ml (3 cups) fresh green beans (cut into 2.5-cm pieces)
- 2 carrots (cut into thick strips)
- 45 ml (3 tbsp) olive oil
- 1 large onion (sliced)
- 450 g (1 pound) fresh mushrooms (sliced)
- 5 ml (1 tsp) lemon pepper seasoning
- 7.5 ml (½ tbsp) garlic salt
- 60 ml (¼ cup) almonds (toasted and slivered)

Preparations

- 1) Place green beans and carrots in 2.5 centimetres of boiling water. Cover and cook until tender but still firm. Drain.
- 2) Add oil to heated skillet. Sauté onions and mushrooms until almost tender. Reduce heat, cover and simmer for 3 minutes.
- 3) Stir in green beans, carrots, lemon pepper seasoning and garlic salt. Cover and cook for 5 minutes over medium heat.
- 4) Finish with almonds. Serve.

The Long-term Effects of COVID-19

It's been more than a year since the pandemic began, and we continue to learn more about the short- and long-term health effects of COVID-19. Although most people get better within weeks, some people experience [long COVID-19](#)—a wide range of symptoms that can last weeks or months. In fact, a new [study](#) found that nearly a quarter of people who tested positive for COVID-19 sought medical treatment for new conditions at least 30 days post infection. Long COVID-19 impacted men and women of all ages—including children—and even people who didn't realize they had COVID-19 in the first place.

Post-COVID-19 conditions were more widespread in patients who had severe cases of COVID-19, but also in a substantial share of patients whose cases lacked symptoms. Based on the study, the following people developed long COVID-19:

- 50 per cent of patients who were hospitalized
- 27.5 per cent of patients who were symptomatic but not hospitalized
- 19 per cent of patients who were asymptomatic

Check out common long-haul symptoms in the infographic below. If you're experiencing conditions unusual for your health history, contact your doctor.

Common Symptoms of Long COVID-19

- Fatigue
- Cough
- Body aches
- Loss of taste or smell
- Shortness of breath

What's Better—Caffeine or Sleep?

A new study in the *Journal of Experimental Psychology* tested how caffeine and sleep can impact your day and overall effectiveness at completing tasks. Experts revealed that caffeine can help you stay awake if you're sleep-deprived, but it likely won't improve your performance on tasks.

Caffeine can help you get through the midday slump, but it isn't a substitute for a good night's sleep. Sleeping is needed to help repair body tissue and cleanse the brain of plaque buildup. Adequate sleep is especially important for people in high-functioning work environments who work long hours, such as medical professionals and truck drivers. Also, not only is coffee a poor substitute for sleep, but overconsumption of caffeine—more than 400 mg daily—can also disrupt sleep.

Awake doesn't necessarily mean alert. Sleep deprivation impairs your ability to complete cognitive tasks that require attention. A simple rule is that you shouldn't attempt any task while sleep-deprived that you would not (or should not) attempt while intoxicated.
